# TarAIntino

The tooling layer for AI movie generation

Written and directed by: Mathilde Cros, Robert Debbas, Maddy Jin, Karlo Vrancic

# AI will change the way we consume media.

That is already happening with social media platforms!

# Movies are next up.

However...

**Even if we had a perfect model that can do everything you imagine, it's VERY HARD to "imagine" a movie**

# TECHNICAL SCALABILITY

1) More copies of our services run when more users arrive
   --> Google Cloud Run automatically scales containers

2) Each user’s progress is saved in a shared storage
   --> Google Cloud Storage (GCS) so any container can continue the job

3) Requests queue instead of failing when systems are busy
   --> Google Pub/Sub queues tasks and retries if API quotas are reached

4) We can upgrade the movie search engine if our database grows
   --> ChromaDB  to Vertex AI Matching Engine for more embeddings

# PERFORMANCE OPTIMISATION

1) Fast taste learning
--> Online Newton Step to maximally reduce uncertainty
--> PCA for more efficient computation

2) Efficient similarity search
--> Approximate Nearest Neighbors retrieval to rapidly find the most relevant movies

3) Smart scheduling
--> Generate sequentially when transitions matter and parallel when independent

4) Reuse across similar users (Further Improvements)
--> Use previous users taste vectors and shots to efficiently generate new shots

# INFRASTRUCTURE CONSIDERATIONS

1) Storage: Google Cloud Storage (GCS)
--> To store embeddings, metadata, shot plans, frames, and even clips

2) Containers: Docker
--> Each task packaged separately and easy to deploy anywhere

3) Vector Database: ChromaDB (or Vertex AI Matching Engine)
--> Stores movie embeddings for similarity search

4) LLM Providers: Gemini 2.5/3.0 pro and Veo 3.1
--> Gemini 2.5/3.0: turns selected movies into a structured plan of K shots
--> Veo 3.1: generates the corresponding video clips from these shots

# Future Development : Next Steps

New AI Models are dropping everyday...

ChatGPT 5 Gemini 2.5 Claude 4.5 Sora 2 (OpenAI) Pika 1.0 Runway Gen-3 Alpha Flux.1 Suno AI v3 Leonardo AI

**The world doesn't just need better models**

**It needs better TOOLS to use them**

# TARAINTINO

The tooling layer for AI movie generation.

We're not competing with giants to build the next model
We're building the modular infrastructure that works with

**Any Model**

When a new model drops
Others rebuild

We just **Plug it in**

Now

Future ?
